In graph theory, the shortest path problem is the problem of finding a path between two vertices (or nodes) in a graph such that the sum of the weights of its constituent edges is minimized.. The problem of finding the shortest path between two intersections on a road map may be modeled as a special case of the shortest path problem in graphs, where the vertices correspond to intersections and ...

In graph theory and theoretical computer science, the longest path problem is the problem of finding a simple path of maximum length in a given graph. A path is called simple if it does not have any repeated vertices; the length of a path may either be measured by its number of edges, or (in weighted graphs) by the sum of the weights of its edges. In contrast to the shortest path problem, which ...

 v_1 and v_2 are adjacent. The degree of v_1 is 1 so it is a pendant vertex. e_1 is a pendant edge. The degree of v_5 is 5. The degree of v_4 is 2. The degree of v_3 is 0 so it is an isolated vertex. In the future, we will label graphs with letters, for example:
