INTERNATIONAL STANDARD 1940-1

Balance Grades Balance Grades are used to specify the allowable residual imbalance for rotating machinery. The ISO 1940 standard defines balance grades for different classes of machinery. (Rigid Rotors Only*) Example: Balance Grade "G2.5" is recommended for Steam Turbines, Machine Tools and Small Electric Armatures.

It specifies balance tolerances, the necessary number of correction planes, and methods for verifying the residual unbalance. Recommendations are also given concerning the balance quality requirements for rotors in a constant (rigid) state, according to their machinery type and maximum service speed.

Balancing Quality within Tolerance (Accepted) $U_{Limit} < U_{Existing}$! Balancing Quality out of Tolerance (Rejected) This article is dedicated to highlight the determination of permissible unbalance. Determination of residual unbalance is left for another article. Balance Quality Determination Methods The permissible unbalance can be determined based on : 1.
