Coupling and cohesion. As Example 8 shows, developers need to deal with the dependencies that arise as a result of their decomposition of a problem and its solution into a number of modules. We say that a module of a system depends on another if it is possible that a change to one module requires a change to another.

list introduces the different types of coupling in increasing order of malignity: 1. Data Coupling (communication via scalar parameters) 2. Stamp Coupling (dependency induced by the type of structured parameters) 3. Control Coupling (parameters are used to control the behavior of a module) 4. Common Coupling (communication via shared global data) 5.

While your logic leading to it is baffling, I agree with this conclusion. That is why we discuss the desire for "low" external coupling and "high" internal cohesion. And to calculate a "coupling" score, it would make sense to consider probability of change rather than just the existence of a potential breakage due to change.  
Incorrect.
