Genetics is a branch of biology concerned with the study of genes, genetic variation, and heredity in living organisms.. Gregor Mendel, a scientist and Augustinian friar, discovered genetics in the late 19th-century.Mendel studied "trait inheritance", patterns in the way traits are handed down from parents to offspring. He observed that organisms (pea plants) inherit traits by way of discrete ...

Human evolution is the evolutionary process that led to the emergence of anatomically modern humans, beginning with the evolutionary history of primates – in particular genus *Homo* – and leading to the emergence of *Homo sapiens* as a distinct species of the hominid family, the great apes.This process involved the gradual development of traits such as human bipedalism and language, as well as ...

Clinical genetics technology involves the detailed analysis of the human genome by four distinct technologies: first, chromosome analysis through the use of banded metaphase chromosomes; second, fluorescence in situ hybridization (FISH) on interphase/metaphase chromosomes; third, molecular genetic techniques involving DNA itself; and fourth, chromosome microarray for high-resolution analysis ...

This book worked great with my class. Very similar to the previous edition so if you need to save money, you could get the older one. It's always recommended that if you've been assigned problems to check out the edition on reserve in your college library just to make sure the numbering hasn't changed.

Restriction Enzymes. The phenomenon of restriction and modification was first observed genetically in 1952-1953 by Luria and Human ( 7) and Bertani and Weigle ( 8), although they referred to it as host-induced, or host-controlled, variation.The authors observed that several different bacteriophages varied in their ability to grow on different host strains.
