Tube sound (or valve sound) is the characteristic sound associated with a vacuum tube amplifier (valve amplifier in British English), a vacuum tube-based audio amplifier. At first, the concept of tube sound did not exist, because practically all electronic amplification of audio signals was done with vacuum tubes and other comparable methods were not known or used.

The output bias circuits supply negative DC voltage to the N type VFETs and positive to the P types. VFETs are also depletion mode parts, where current likes to flow with 0 volts input, and the bias circuit is like using a brake pedal.
